

Task Mining Client configuration

Research findings and recommendations

Product Design · Mahalakshmi Ravikumar

28 July 2026

What we'll cover

01 Background & objectives

02 How we ran it

03 What we found

04 What the research points to

05 What we validated

06 Recommendations & next steps

01

Background & objectives

Why we ran this research, and what
we set out to learn

The problem we set out to understand

Fragmented setup

Split across a Basic web app and an Advanced desktop editor

Most real setup needs the Advanced editor

Moving between them is manual and file-based

Windows-only editor

The Advanced editor runs only on Windows

Mac admins must procure or emulate a PC

Raised by every participant, including our own VEs

Opaque controls & noise

Technical labels like UIAA go unexplained

Events vs. logs never made intuitive sense

Everything captured by default buries the signal

02

How we ran it

In-depth interviews and navigation
testing with admins and VEs

Objectives, method and participants

Objectives

Understand how IT admins
configure the client today

Surface pain points in the
configuration workflow

Learn which settings matter
most — and least

Method

In-depth qualitative
interviews, 45–60 min

Tree / first-click navigation
testing

Grouped review of the event
and data lists

Participants

6 in interviews — 5 internal
VEs, 1 CoE (Allianz)

VEs who configure for
Goldman Sachs, Wells Fargo

PM and UXD observing each
session

Scope & status

Interviews complete; IA
validated via nav tests

2 navigation sessions run · 20
Jul 2026

Directional but consistent —
a 3rd is pending

03

What we found

Three themes from interviews and testing

Three themes across the research

Configuration is fragmented

Config files downloaded, edited and re-uploaded by hand

Every participant felt the friction

All agree: bring Advanced into the web portal

The IA is bloated

Over-engineered, with ambiguous controls

Raw backend complexity exposed to admins

Text editor and many event rules go unused

Validation is ignored

The built-in preview isn't trusted or used

Admins capture broad, then prune from real data

The live monitor is hidden from who needs it

Fragmented IA

Basic vs. Advanced is confusing and restrictive

Core functions hidden behind multiple clicks

A one-way street between the two modes

Windows barrier

The Advanced editor is Windows-only

Blocks setup before capture even begins

Directly delays time-to-value

Opaque controls

Jargon with no in-product guidance

Admins pick options they don't understand

Or stall waiting on support

Noisy defaults

Everything is captured by default

Many fields add no analytical value

Hard to tell signal from noise

Granularity isn't the
problem.
Making it
understandable is.

04

What the research points to

Capture levels, and one object-
based structure

From two surfaces to one journey

Today

Basic web app plus a separate Advanced desktop editor

Windows-only, file-based — settings scattered across tabs

Admins guess which mode they need, and get stuck between them

Proposed

One guided surface — no Basic or Advanced split

Capture level chosen in context, per rule

Full control preserved, now comprehensible and OS-independent

One decision, three capture levels

Full

Captures everything — events, attributes and screenshots

For processes you want to analyse in depth

The default, matching how the client behaves today

Custom

Captures that an app was used, plus element names

No typed text, selected values or screenshots

For sensitive screens or a first discovery pass

Deny

Captures nothing for that scope

For apps or URLs to exclude entirely

Nothing to redact or preview

One object-based structure

Capture Rules

The core: what Task Mining records, and where

Each rule sets scope, capture level and captured data

A default rule catches anything not covered

Privacy & Consent

Redaction, with the ability to test the result

Hashing of usernames and machine IDs

User consent — all in one place

Behaviour & data

Client Behaviour: recording, startup, live monitor

Data Connection: where captured data is sent

SAP and other sources appear only when relevant

05

What we validated

Navigation testing with value
engineers

The structure held up — one thing to fix

IA validated

Both VEs landed in the right area on every task

Privacy for redaction, Capture Rules for targeting

Safe to design and build against

The naming failed

Neither could explain Full vs. Usage-only

The strongest signal across both sessions

The confusion lived in the level selector

What we changed

Renamed Usage-only to Custom

Adding a “what this captures” summary

Re-testing the rename before hi-fi

06

Recommendations & next steps

What ships first, and what we recommend

What ships first

MVP

One unified, guided configuration surface

Capture levels with clean, de-noised event lists

Core privacy — redaction, hashing, consent

Post-MVP

Advanced redaction — GDPR/HIPAA libraries, test-on-sample

Validation in EMS and the configuration simulator

New projects only; reuse by duplicating rule sets

How we'll measure success

Time-to-valid-config

From starting a config

to a validated, deployable
rule set

New flow vs. today's baseline

Errors & rework

Misconfigurations and re-
uploads

Config-related support
tickets

Read after launch

Task success

Tree and usability test
success

Directness of navigation

Can admins explain the
levels

Redaction misses

Sensitive values that slip
through

Compliance escalations

Plus VE feedback on data
quality

Build on what held up

The object-based IA validated — design against it

Ship capture levels — Full, Custom, Deny — in the MVP

Strip noise fields; reveal situational data only when enabled

De-risk before hi-fi

Re-test the Usage-only → Custom rename

Prove a “what this captures” summary resolves the confusion

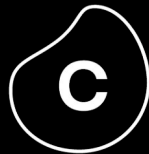

Give the level selector the most design attention

Open decisions to close

Where SAP enablement lives — global or within a rule

Admin-gated access and roles for the live event monitor

Element ID / class name — needed for agentic blueprints?

Thank you.
